

skycities of montréal

Urbanity will no longer exist as we know it in the contemporary condition. Our ability to communicate within and in between cities has completely altered how we live.

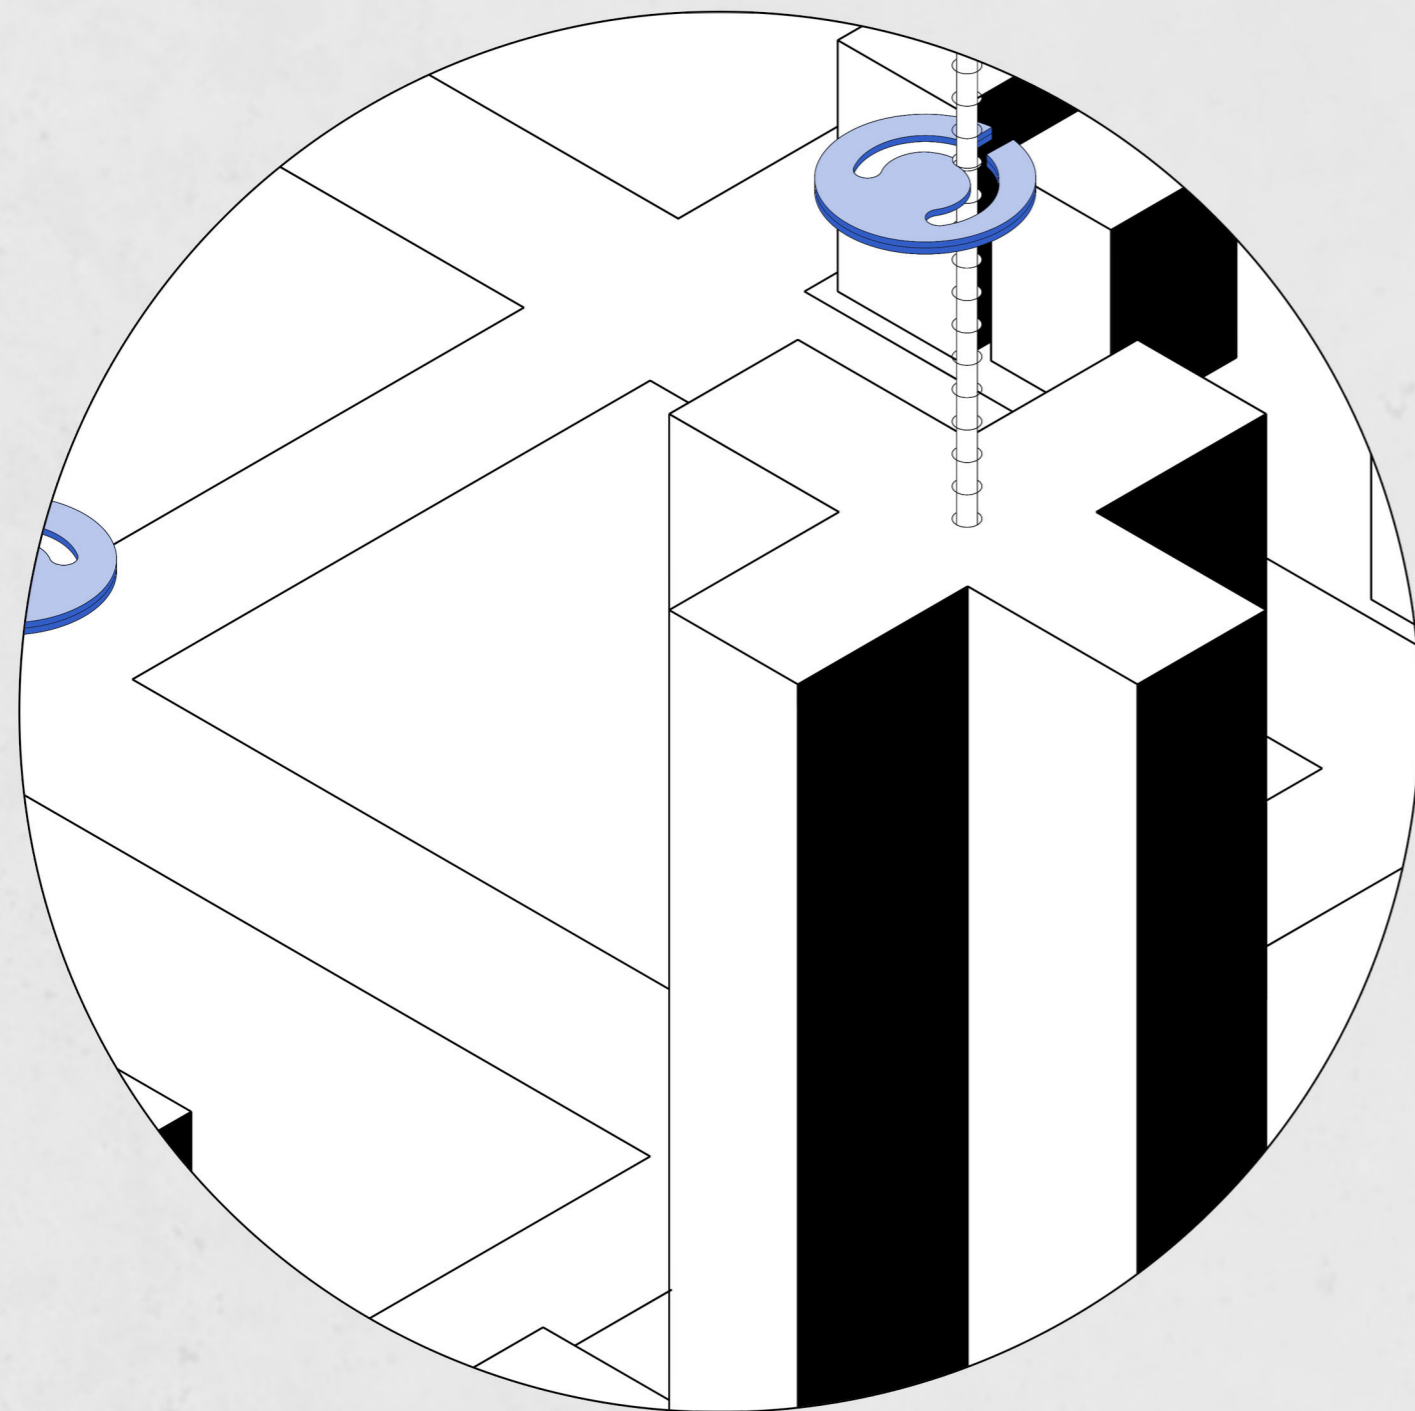

Our obsession with the ability of being omnipresent will continue to be fuelled further through future advances in wireless information technology and increasingly efficient methods of storage.

Cities will disappear, pockets of space will sporadically appear wherever one wishes- these spaces will spontaneously vanish as quickly as they had intially appeared.

Touch, sight, smell, taste, hearing- natural qualities of the human self are currently in a state of dilution by means of digital technology. Certain basic human traits are no longer required for us to sustain ourselves in the urban environment. We have created methods by which we possess the ability to live lighter, thereby enhancing our ability to live remotely.

However decentralized, mobile and ephemeral we believe our society is now becoming through the popularization of the mobile phone and wireless technology- we will in fact become a more physical society in 2063 than ever before.

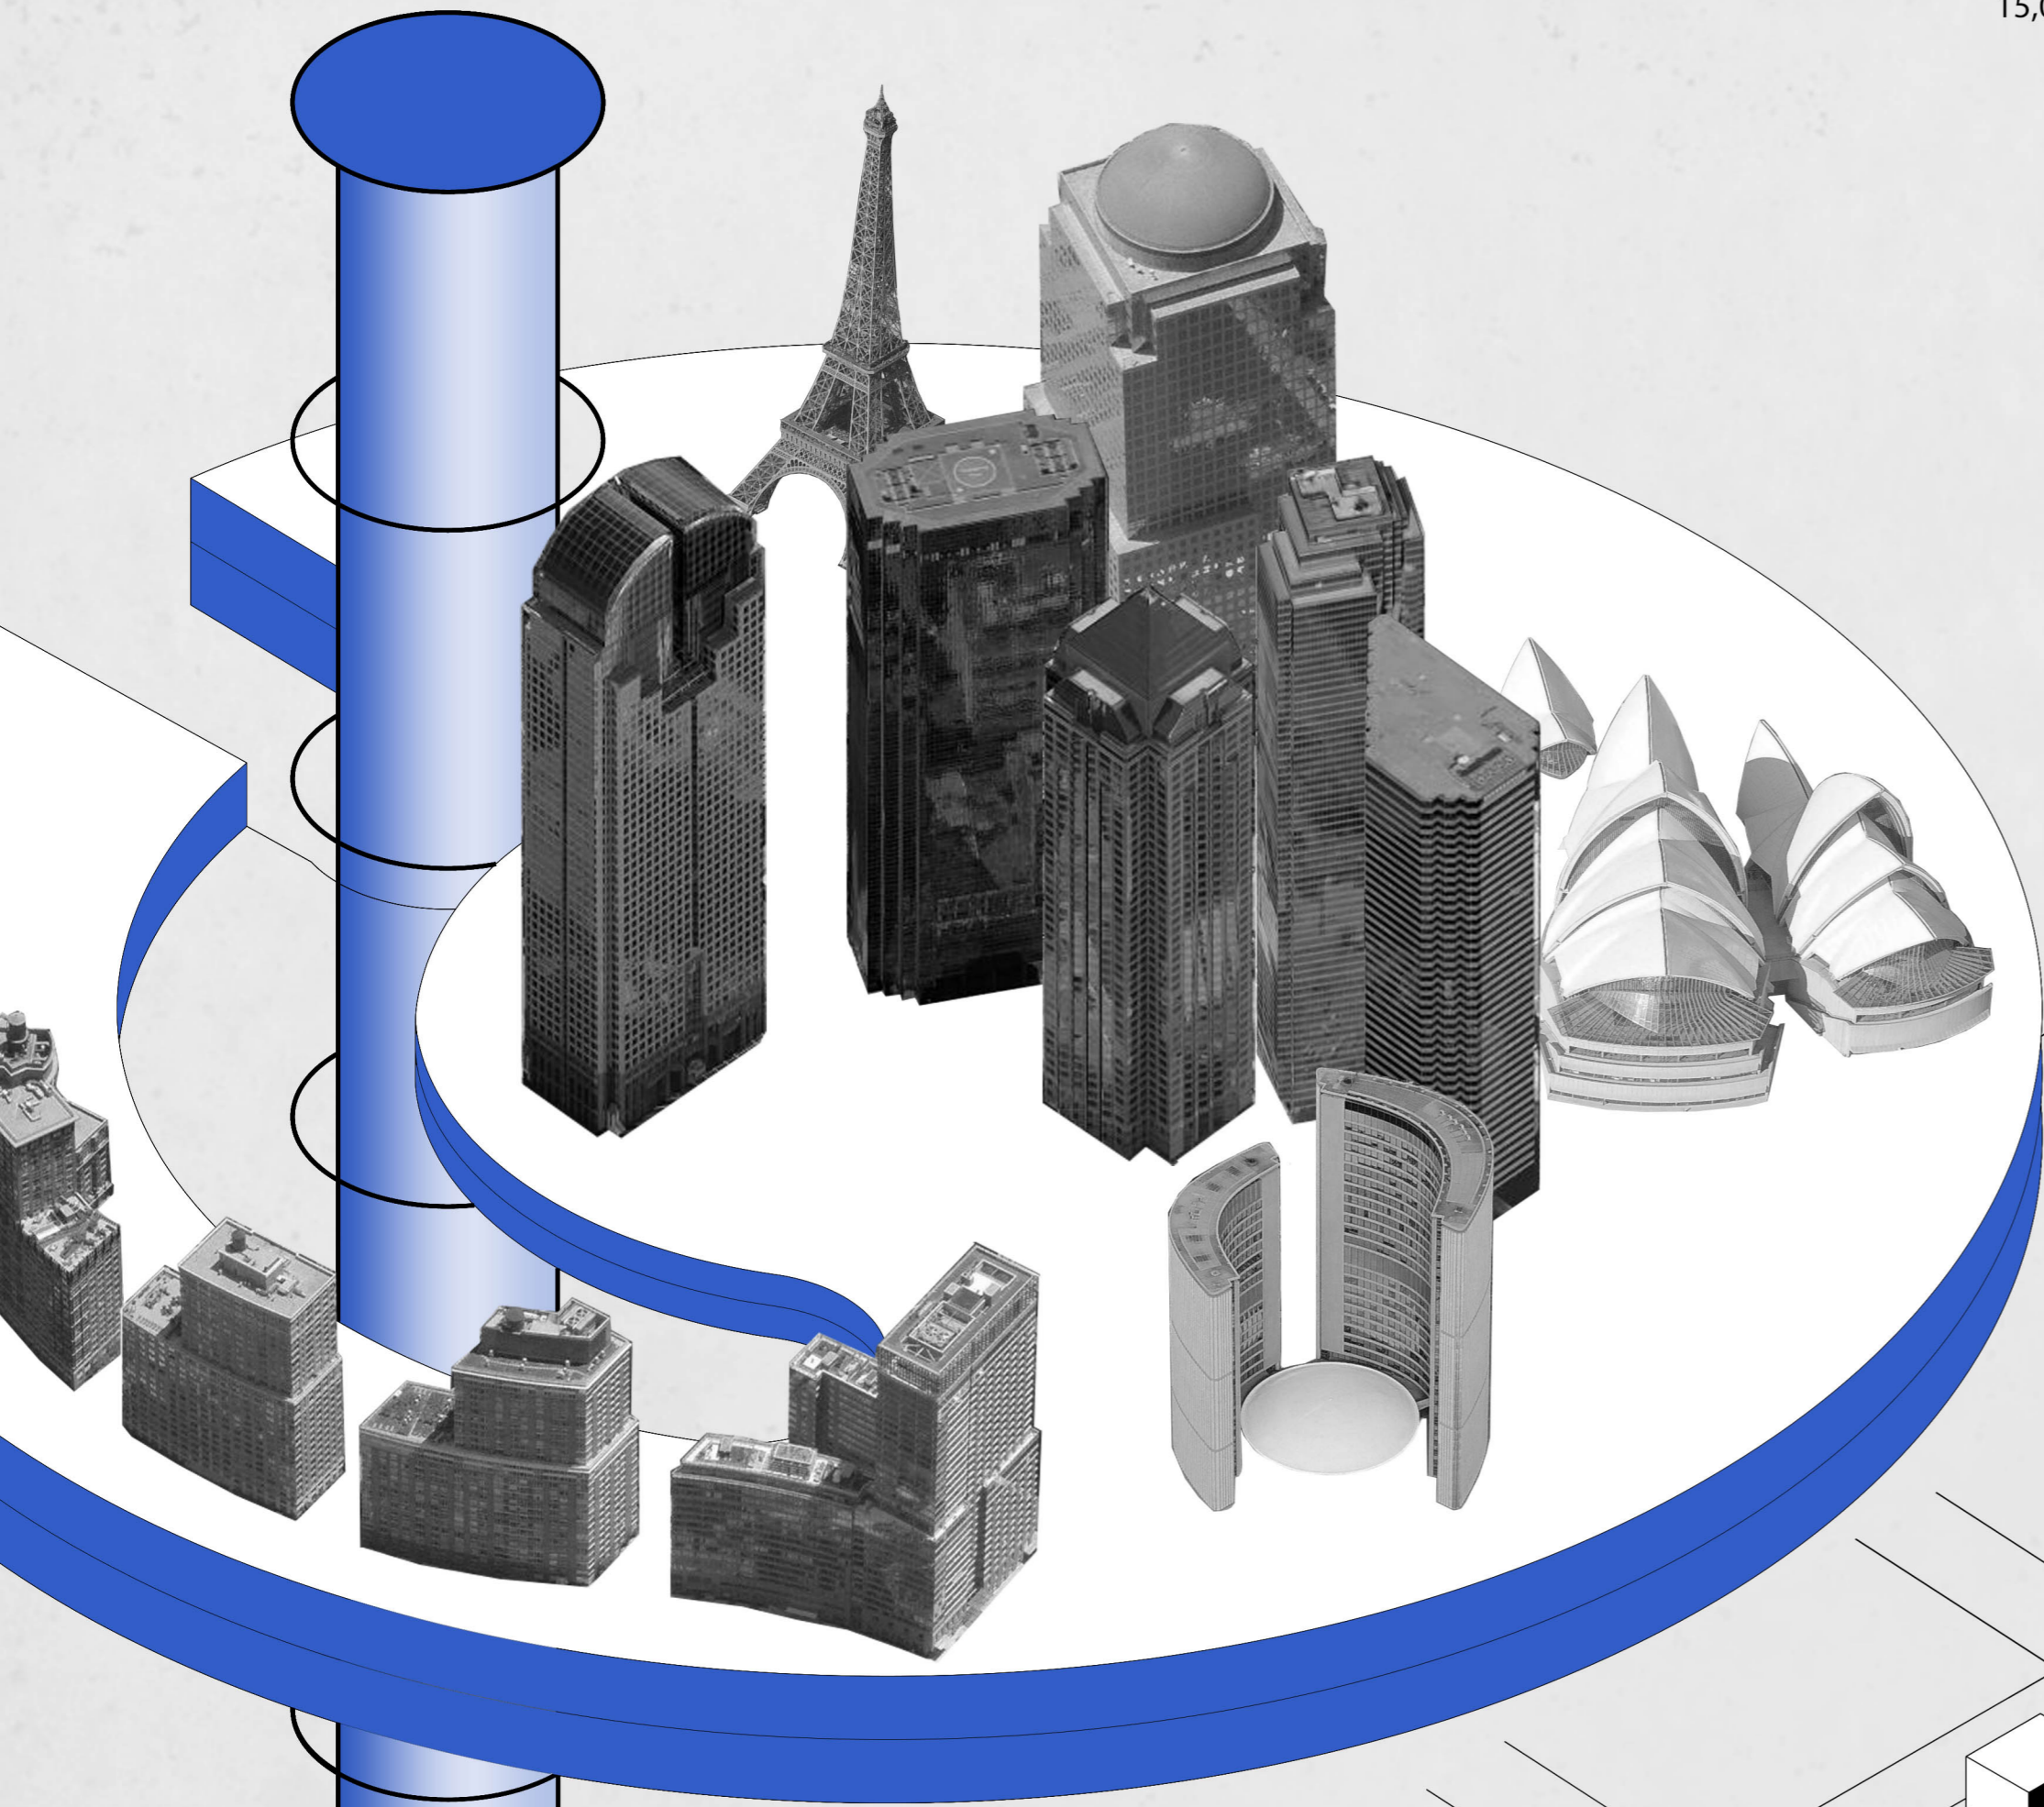

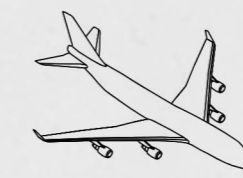

Rising tides, international political instability and the continued unrest in the Middle East will cause global panic and necessitate the construction of denser, taller and bigger cities. Montreal will become the pillar, hosting the future world.

It is 2063, entire blocks of foreign cities are being re-constructed atop the skycity platforms.

The greater city of Montréal acts as host and is also in a state of re-reconstruction.
